# CSE 421/521 - Operating Systems Spring 2018

LECTURE - XVII

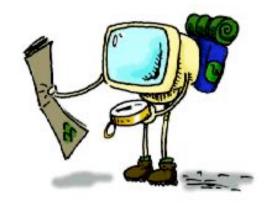

VIRTUAL MEMORY - II

Tevfik Koşar

University at Buffalo April 5th, 2018

## Roadmap

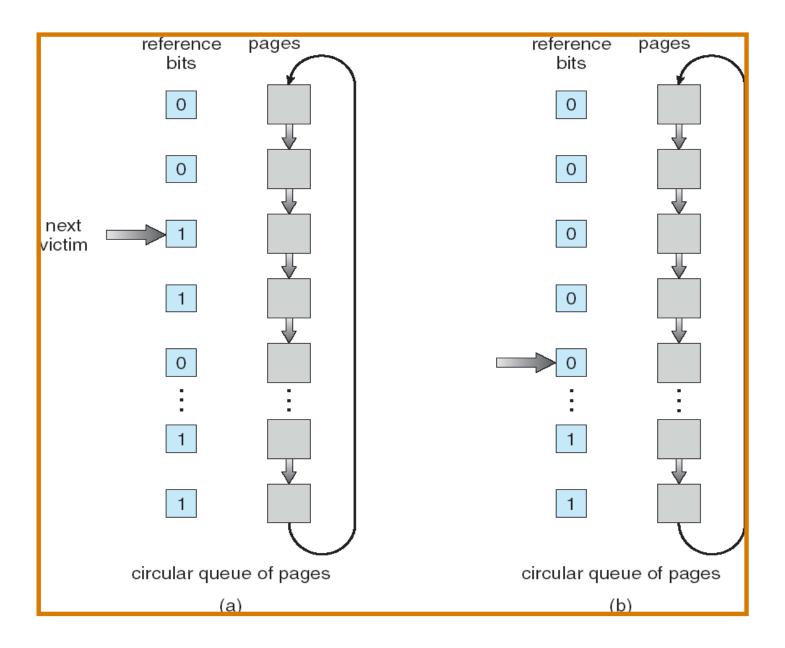

- Virtual Memory
  - LRU Clock Algorithm
  - Counting Algorithms
  - Performance of Demand Paging
  - Allocation Policies
  - Thrashing
  - Working Set Model

## LRU Clock Algorithm

- AKA Not Recently Used (NRU) or Second Chance
  - replace page that is "old enough"
  - logically, arrange all physical page frames in a big circle (clock)
    - just a circular linked list
  - a "clock hand" is used to select a good LRU candidate
    - sweep through the pages in circular order like a clock
    - if ref bit is off, it hasn't been used recently, we have a victim
      - so, what is minimum "age" if ref bit is off?
    - if the ref bit is on, turn it off and go to next page
  - arm moves quickly when pages are needed
  - low overhead if have plenty of memory
  - if memory is large, "accuracy" of information degrades
    - add more hands to fix

#### Second-Chance (clock) Page-Replacement Algorithm

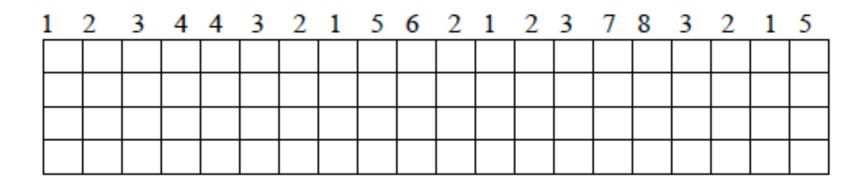

## Example

• Consider the following page-reference string:

Assuming 4 memory frames and LRU-Clock algorithm, how many page faults, page hits, and page replacements would occur? Show your page assignments to frames.

Consider the following rules:

- 1. When a page is brought to the memory the first time, initialize reference bit to 0.
- 2. Advance the next victim pointer only if you need to find a victim page to replace,

# of page faults:

# of page hits:

# of page replacements:

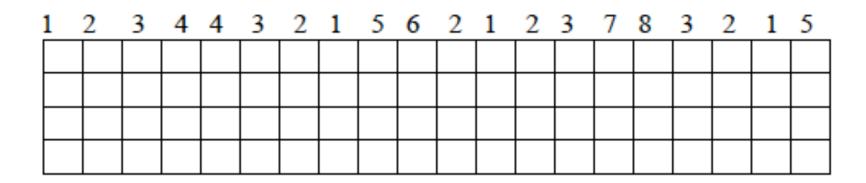

## Counting Algorithms

- Keep a counter of the number of references that have been made to each page
- LFU Algorithm: replaces page with smallest count
- MFU Algorithm: based on the argument that the page with the smallest count was probably just brought in and has yet to be used

## Exercise

• Consider the following page-reference string:

Assuming 4 memory frames and LRU, LRU-8bit, LFU, MFU, or Optimal page replacement algorithms, how many page faults, page hits, and page replacements would occur? Show your page assignments to frames.

- # of page faults:
- # of page hits:
- # of page replacements:

# Performance of Demand Paging

- Page Fault Rate  $0 \le p \le 1.0$ 
  - if p = 0 no page faults
  - if p = 1, every reference is a fault
- Effective Access Time (EAT)

```
EAT = (1 - p) \times memory access
```

- + p x (page fault overhead
  - + [swap page out]
  - + swap page in
  - + restart overhead
  - + memory access)

## Demand Paging Example

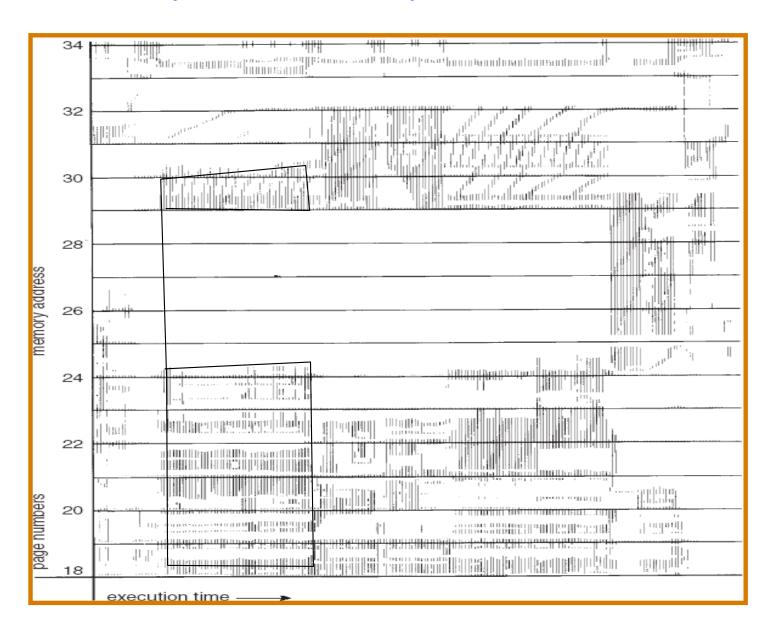

- Memory access time = 1 microsecond
- 50% of the time the page that is being replaced has been modified and therefore needs to be swapped out
- Swap Page Time = 10 msec = 10,000 microsec
- EAT = ?

## **Demand Paging Example**

- Memory access time = 1 microsecond
- 50% of the time the page that is being replaced has been modified and therefore needs to be swapped out
- Swap Page Time = 10 msec = 10,000 microsec
- EAT =  $(1 p) \times 1 + p \times (10,000 + 1/2 \times 10,000 + 1)$ =  $1 + 15,000 \times p$  (in microsec)
- What if 1 out of 1000 memory accesses cause a page fault?

What if we only want 30% performance degradation?

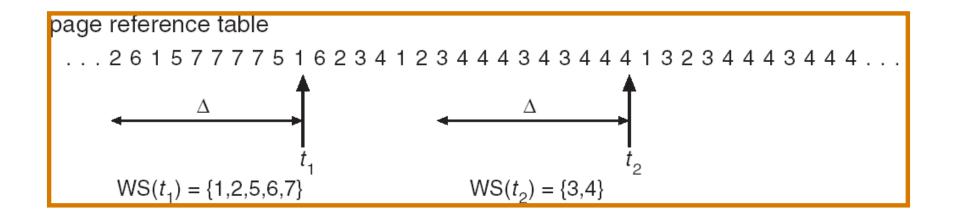

## Locality in a Memory-Reference Pattern

# Working-Set Model

- Δ ≡ working-set window ≡ a fixed number of page references
   Example: 10,000 instruction
- $WSS_i$  (working set of Process  $P_i$ ) = total number of pages referenced in the most recent  $\Delta$  (varies in time)
  - if  $\Delta$  too small will not encompass entire locality
  - if  $\Delta$  too large will encompass several localities
  - if  $\Delta = \infty \Rightarrow$  will encompass entire program
- $D = \sum WSS_i = \text{total demand frames}$
- if  $D > m \Rightarrow$  Thrashing
- Policy if D > m, then suspend one of the processes

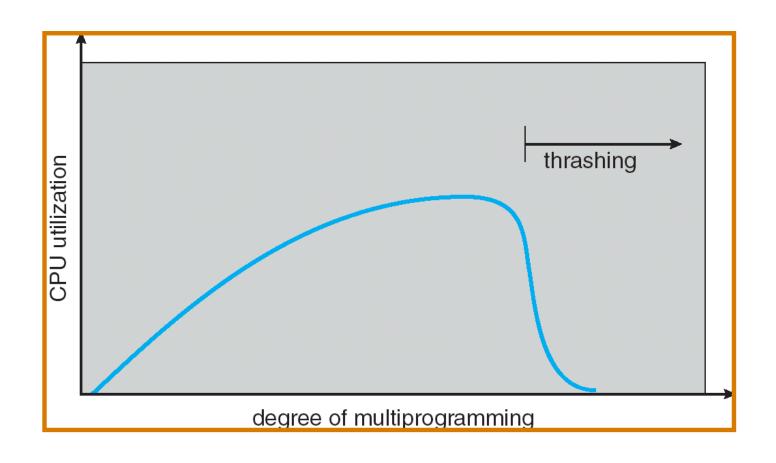

# Working-set model

# **Thrashing**

- If a process does not have "enough" frames, the page-fault rate is very high. This leads to:
  - Replacement of active pages which will be needed soon again
  - → Thrashing = a process is busy swapping pages in and out
- Which will in turn cause:
  - low CPU utilization
  - operating system thinks that it needs to increase the degree of multiprogramming
  - another process added to the system

# Thrashing (Cont.)

## Exercise - 1 (a)

Consider a demand-paged computer system where the degree of multiprogramming is currently fixed at four. The system was recently measured to determine utilization of CPU and the paging disk. The results are one of the following alternatives. For each case, what is happening (in one phrase)? Can you increase the degree of multiprogramming to increase the CPU utilization?

a) CPU utilization 96 percent; disk utilization 4 percent.

## Exercise - 1 (a)

Consider a demand-paged computer system where the degree of multiprogramming is currently fixed at four. The system was recently measured to determine utilization of CPU and the paging disk. The results are one of the following alternatives. For each case, what is happening (in one phrase)? Can you increase the degree of multiprogramming to increase the CPU utilization?

a) CPU utilization 96 percent; disk utilization 4 percent.

Answer: CPU utilization is sufficiently high to leave things alone (there are already sufficient processes running to keep the CPU busy); increasing the degree of multiprogramming may decrease the CPU utilization.

## Exercise - 1 (b)

Consider a demand-paged computer system where the degree of multiprogramming is currently fixed at four. The system was recently measured to determine utilization of CPU and the paging disk. The results are one of the following alternatives. For each case, what is happening (in one phrase)? Can you increase the degree of multiprogramming to increase the CPU utilization?

b) CPU utilization 10 percent; disk utilization 95 percent.

## Exercise - 1 (b)

Consider a demand-paged computer system where the degree of multiprogramming is currently fixed at four. The system was recently measured to determine utilization of CPU and the paging disk. The results are one of the following alternatives. For each case, what is happening (in one phrase)? Can you increase the degree of multiprogramming to increase the CPU utilization?

b) CPU utilization 10 percent; disk utilization 95 percent.

Answer: Thrashing is occurring. We cannot increase the CPU utilization

## Exercise - 1(c)

Consider a demand-paged computer system where the degree of multiprogramming is currently fixed at four. The system was recently measured to determine utilization of CPU and the paging disk. The results are one of the following alternatives. For each case, what is happening (in one phrase)? Can you increase the degree of multiprogramming to increase the CPU utilization?

c) CPU utilization 12 percent; disk utilization 2 percent.

# Exercise - 1 (c)

Consider a demand-paged computer system where the degree of multiprogramming is currently fixed at four. The system was recently measured to determine utilization of CPU and the paging disk. The results are one of the following alternatives. For each case, what is happening (in one phrase)? Can you increase the degree of multiprogramming to increase the CPU utilization?

c) CPU utilization 12 percent; disk utilization 2 percent.

Answer: both CPU and disk utilization are low, and CPU is obviously underutilized. We should increase the degree of multiprogramming to increase CPU utilization.

## Exercise - 2 (a)

• Consider a demand-paging system with the following time-measured utilization:

CPU utilization 18% Paging disk 96% Other I/O devices 6%

For each of the following, say whether it will (or is likely to) improve CPU utilization. Answer with YES or NO or LIKELY, and justify your answers.

(a) Install a faster CPU.

## Exercise - 2 (a)

• Consider a demand-paging system with the following time-measured utilization:

CPU utilization 18% Paging disk 96% Other I/O devices 6%

For each of the following, say whether it will (or is likely to) improve CPU utilization. Answer with YES or NO or LIKELY, and justify your answers.

(a) Install a faster CPU.

NO. a faster CPU reduces the CPU utilization further since the CPU will spend more time waiting for a process to enter in the ready queue.

## Exercise - 2 (b)

• Consider a demand-paging system with the following time-measured utilization:

CPU utilization 18% Paging disk 96% Other I/O devices 6%

For each of the following, say whether it will (or is likely to) improve CPU utilization. Answer with YES or NO or LIKELY, and justify your answers.

(b) Install a bigger paging disk.

## Exercise - 2 (b)

• Consider a demand-paging system with the following time-measured utilization:

CPU utilization 18% Paging disk 96% Other I/O devices 6%

For each of the following, say whether it will (or is likely to) improve CPU utilization. Answer with YES or NO or LIKELY, and justify your answers.

(b) Install a bigger paging disk.

NO. the size of the paging disk does not affect the amount of memory that is needed to reduce the page faults.

## Exercise - 2 (c)

• Consider a demand-paging system with the following time-measured utilization:

CPU utilization 18% Paging disk 96% Other I/O devices 6%

For each of the following, say whether it will (or is likely to) improve CPU utilization. Answer with YES or NO or LIKELY, and justify your answers.

(c) Decrease the degree of multiprogramming.

## Exercise - 2 (c)

• Consider a demand-paging system with the following time-measured utilization:

CPU utilization 18% Paging disk 96% Other I/O devices 6%

For each of the following, say whether it will (or is likely to) improve CPU utilization. Answer with YES or NO or LIKELY, and justify your answers.

(c) Decrease the degree of multiprogramming.

YES. by suspending some of the processes, the other processes will have more frames in order to bring their pages in them, hence reducing the page faults.

## Exercise - 2 (d)

• Consider a demand-paging system with the following time-measured utilization:

CPU utilization 18% Paging disk 96% Other I/O devices 6%

For each of the following, say whether it will (or is likely to) improve CPU utilization. Answer with YES or NO or LIKELY, and justify your answers.

(d) Install more main memory.

## Exercise - 2 (d)

• Consider a demand-paging system with the following time-measured utilization:

CPU utilization 18% Paging disk 96% Other I/O devices 6%

For each of the following, say whether it will (or is likely to) improve CPU utilization. Answer with YES or NO or LIKELY, and justify your answers.

(d) Install more main memory.

Likely. more pages can remain resident and do not require paging to or from the disks (i.e. would depend on the page replacement algorithm you are using and the page reference sequence).

## Allocation of Frames

- We should allocate each process at least a minimum number of frames.
- Two major allocation schemes
  - fixed allocation
  - priority allocation

## **Fixed Allocation**

- Equal allocation For example, if there are 100 frames and 5 processes, give each process 20 frames.
- Proportional allocation Allocate according to the size of process

$$s_i$$
 = size of process  $p_i$   
 $S = \sum s_i$   
 $m$  = total number of frames  
 $a_i$  = allocation for  $p_i = \frac{s_i}{s} \times m$ 

$$m = 64$$
  
 $s_i = 10$   
 $s_2 = 127$   
 $a_1 = \frac{10}{137} \times 64 \approx 5$   
 $a_2 = \frac{127}{137} \times 64 \approx 59$ 

## **Priority Allocation**

- Use a proportional allocation scheme using priorities rather than size
- If process P<sub>i</sub> generates a page fault,
  - select for replacement one of its frames
  - select for replacement a frame from a process with lower priority number

#### Global vs. Local Allocation

- Global replacement process selects a replacement frame from the set of all frames; one process can take a frame from another
- Local replacement each process selects from only its own set of allocated frames

# Summary

- Virtual Memory
  - LRU-Clock Algorithm
  - Counting Algorithms
  - Performance of Demand Paging
  - Allocation Policies
  - Thrashing
  - Working Set Model

• Reading Assignment: Chapter 9 from Silberschatz.
